LONE WORKER / MAN DOWN / RADIO PANIC ALARM SYSTEM

Transmitter

The Lone Worker is ideal for many applications where staff have to work alone, security personnel and for health and safety applications. The Lone Worker transmitter is worn on belt or pocket and held securely with a belt clip. It transmits an alarm message when the panic button is pressed. The transmitter also contains a tilt switch so that an alarm message is transmitted automatically if the person collapses for any reason. The automatic transmission occurs after 10 second period during which a warning beep gives an alert that a alarm message is about to be transmitted. The message transmission is cancelled automatically by movement of the transmitter. Radio range is 500 metres with standard antenna.

A radio repeater can be installed on large sites to increase the range between transmitters and receiver.

Radio Repeater

14 zone receiver

The receiver receives from up to 14 transmitters. An LED lamp flashes and the internal sounder is activated when an alarm message is received. A write-on label is used to identify the alarm transmitter number with the person's name. The reset switch is used to cancel the alarm. External devices can be connected to the receiver such as an additional sounder and a telephone autodialler. An external antenna can be attached to increase radio range.
